

If you were invited to take part in a game themed around adaptation, what would be your response?

What type of climate-related games have you experienced before, if any?

From your perspective, what are the potential benefits of a game approach to adaptation?

Bring people who wouldn't be interested normally into the conversation

No Powerpoint slides

Better learning

See different perspectives

helps us see other peoples perspectives

test scenarios

Helps bring greater awareness to the topic

Blue sky thinking

From your perspective, what are the potential benefits of a game approach to adaptation?

More approachable for
the layperson

Freedom to take risks

More practical
understanding

helping people think
about it without
becoming too depressed

exploring decision space
& evaluating
consequences

understanding uncertainty,
incomplete information,
unknown consequences in an
embodied way

Learn and share from other
perspectives and experiences
of climate risks

Teaching and learning
tool to engage a variety
of audiences

From your perspective, what are the potential benefits of a game approach to adaptation?

Immersive

Let go of real-world
political, financial barriers

Interactive learning

understanding risks,
limits, thresholds

Learn without a
struggle....with joy and fun

Bit removed from reality -
allows more creativity /
positivity

Creating a shared
understanding across
disciplines (NHS)

hopefully no jargon

From your perspective, what are the potential benefits of a game approach to adaptation?

Thinking differently

Engages those who may otherwise fail to engage

Informal learning

pushes decision making

Help people to understand in a different way

Different perspective

exploring without consequences

New ideas

From your perspective, what are the potential benefits of a game approach to adaptation?

Can see the impact of different actions

Bringing personal experiences

Lowers the "classroom" aversion hurdle, and always excavates new knowledge and gaps in it

low risk in terms of 'the right answer'

Encourages different thinking

making adaptation more relateable to them...

Hoping for creativity, more lively, less dour than planning ...

bring people with different perspectives/outlooks together with less conflict

From your perspective, what are the potential benefits of a game approach to adaptation?

discuss on the spot

Easier to understand for those who don't understand complex terminology

Fun

Engaging for different learning styles

Maybe even get a response from your MP

help young people prepare

Can see how things play out differently with different inputs or randomness

You can play as different characters

From your perspective, what are the potential benefits of a game approach to adaptation?

Reflective

bring people together in
the same space

Good for children (and
politicians)

having a laugh

Can lighten a serious
subject

Fools die laughing still....

From your perspective, what are the potential limitations of a game approach to adaptation?

may be seen as boring

Where do we go from there...

Getting senior engagement

not many people play games

Not taken as seriously as should be

Understanding the rules of the game

Maybe too black and white, perhaps not enough nuance. Simplified?

how impactful it is - default back to BAU

From your perspective, what are the potential limitations of a game approach to adaptation?

might go nowhere

maladaptation

Introverts have a hard time as well as those whose brains like quiet time to think

harder to see the long term gains

Could be misunderstood as accepting climate change and stopping action on mitigation

Time it takes

Doesn't necessarily lead to follow up action if compartmentalised as a 'game'

may only allow basic understanding of the subject

From your perspective, what are the potential limitations of a game approach to adaptation?

Master's students
perceive it as 'not serious
enough'

learning is not taken
forward

Over-simplification

Oversimplification- how
do you help people
understand complexity?

Will any action actually
happen after

potentially appears immature
approach to serious subject
to those that relate games to
childhood

How to take it into life
actions

Do we really take games
seriously enough?

From your perspective, what are the potential limitations of a game approach to adaptation?

People may see it as beneath them - senior colleagues are time poor so cannot be protracted

Might set unrealistic expectations as to what can be achieved

Lots of ideas can be shared but realistically how many of these ideas can be pushed forward and who takes the lead on these

moving results into reality

Opportunities to cheat

Too abstract

busy and overcrowded market - if no one will actually play is there any point?

Doesn't seem 'real'

From your perspective, what are the potential limitations of a game approach to adaptation?

Downplays the urgency

Civilisation collapse is just a game

Competitive

Is life also just a game?

What happens if you always win or always lose? Leading to overoptimism or a doom spiral. How do you pitch it right?

If its played in person you need storage for equipment

Potential for criticism (I still remmeber hearing a Radio 4 news item about a team that tried to use lego with councillors...

Organising it
